ALASKA INDUSTRIAL DEVELOPMENT AND EXPORT AUTHORITY
SKAGWAY ORE TERMINAL
SHIP LOADER STRUCTURAL INSPECTION
November 11, 12 and 13, 2013

R&M Consultants, Inc.

Extreme Access Inc.

December 17, 2013

Executive Summary

R&M Consultants, Inc. with sub-consultants Extreme Access Inc., performed a detailed visual inspection of the structural elements of the Skagway Ore Terminal Ship Loader November 11 through 13, 2013. The structural inspection was performed concurrently with the Spout Recertification Inspection performed by Crane Repair Services. The ship loader was found to be in need of extensive remedial repairs to bring the structural elements to a safe and usable condition that would allow use in loading ships for the near future until either a new ship loader is installed or the existing unit is completely rehabilitated for long term use.

The present structural condition is marginal and the facility should not be used for ship loading until remedial repairs are made to critical structural elements in the boom and guide towers.

TABLE OF CONTENTS

Introduction

R&M Consultants Inc. (R&M) was engaged by AIDEA to perform a detailed structural condition inspection of the Skagway Ore Terminal Ship Loader (SOT). This inspection was performed the week of November 11, 2013 and was done by a special inspection team formed by R&M with sub-consultant Extreme Access Inc. (EAI). The R&M team personnel included certified steel bridge inspections from EAI who are also technical climbers. The R&M team personnel included John K. Magee, P.E. of R&M (overall team leader), Scott Hibbs, P.E. of EAI (lead inspector), Peter Fralick of EAI (senior inspector) and John Gonzales of EAI (inspector).

The on-site inspection was performed November 11, 12 and 13, 2013 during a weather window in which temperatures were generally just above freezing, wind was sporadic and in the 3 to 5 mph range and no significant precipitation occurred. The climbing inspection by R&M/EAI was done concurrently with the spout certification inspection by Lance Gyldenege of Crane Repair Services (CRS), the Certified Spout Inspector who was under separate contract to AIDEA. Close coordination between R&M/EAI climber/inspectors and Mr. Gyldenege was maintained throughout the inspection which ensured the maximum inspection effectiveness and efficiency could be maintained. The weather deteriorated significantly on November 14th but the field inspection had been completed and the combined inspection team departed Skagway.

Facility Description

The ship loader is installed on a pile supported foundation comprising a reinforced concrete base slab/pile cap supported in turn by steel pipe piling driven into the harbor bottom. See **Appendix 2** for general views of the ore dock and ship loader. The Skagway Ore Terminal comprises a Concentrate Storage Building, truck unloading facility, reclaim, transfer, and ship loading conveyors and support facilities including equipment wash facility, laboratory building, two MCC's, vehicle repair/maintenance shop and office/lunch room/ shower and locker room. Electric power to operate the motors, controls and lights on the ship loader originate in the main MCC.

Aerial view of the Skagway Ore Terminal looking East

The ship loading conveyor is mounted on a shuttle frame that runs on I-beam runways at the tail and head of the conveyor and on carrier wheels supported by structural members within the plate girder boom. The boom is mounted in a hoisting cage frame that is raised and lowered to follow the hatch coaming as ship draft and tide levels change during ship load out. The hoisting cage is attached by cable to counterweights in the north and south guide towers and hoisting winches and guide sheaves are set on top of a hoisting equipment bridge spanning across the tops of the two guide towers and lower sheaves are mounted on the concrete base of the ship loader.

Ore Dock and SOT Ship Loader viewed from the water

Reference drawings of original construction of the ship loader facilities are included in **Appendix 6**.

Scope of inspection

The structural inspection scope included inspecting and evaluating the ship loader boom structure and hoist support tower structural members and reporting on the condition of the facility. The inspection was visual and included welded joints, bolted joints and tower column base plates and ancillary elements. No non-destructive testing/examination was done. Inspection of operating mechanical features was performed and report of findings was prepared by Crane Repair Services under separate contract with AIDEA.

Inspection Methods

Inspectors accessed the North and South hoist tower columns and frame panel points using rope and technical climbing equipment and techniques. This approach was adopted due to the flexibility of access for the inspectors. Use of bucket truck(s) or man lifts is not consistent with the flexible access needed due to the lack of access for equipment all around the ship loader due to condition of the ore dock and the need for inspectors to view areas not easily accessed by man lift or bucket truck.

Each element inspected was “scored” using structural Condition State (CS) descriptions based on accepted steel structure Condition State Descriptions for painted steel structures from the 2009 Oregon Department of Transportation Bridge Inspection Coding Guide. This Guide provides narrative descriptions and reference photographs of various coating and steel corrosion conditions and assigns a

number from CS1 (best) to CS5 (worst) along with notes on possible actions to be taken to remediate the condition. A copy of the reference table is included as **Appendix 1-1 and Appendix 1-2** shows a view of the East face of the Ship Loader with many of the structural joints with deficiencies indicated.

Each panel point/node in the structural system was examined and if the condition state was less than CS2 photographs were not taken. If the condition state was higher (more severe) the element was closely inspected by scraping away any loose paint, dirt, residual concentrate, rust scale, etc. and visually evaluating the structural material section loss, condition of metal surfaces, etc. Photos were then taken of the particular element and the condition logged with comments. The notes and accompanying photographs are included in **Appendices 3, 4 and 5**.

Inspection Activity

Inspection activities were as follows by date indicated:

November 11, 2013

Weather was fair, 39 degrees F, calm, clear and sunny with occasional light wind.

The R&M team arrived in Skagway by State Ferry mid-day November 11, 2013 where we were joined by the spout inspector. The combined inspection team (R&M/EAI/CRS) spent the afternoon assessing the structures to be inspected from the standpoint of access and safe work practices and reviewing and discussing the job safety plan and work plan with Dave Hunz and Gene Lindfors of MSI. This included operation of the ship loader boom luffing and hoist systems for spout inspection and to facilitate access by EAI personnel for safe inspection of the structural systems. The combined inspection team inspection visited the MCC with Dave Hunz to discuss LOTO to ensure the ship loader could be isolated from energy sources, “walked” the transfer conveyor to the ship loader cage platform, walked around the ship loader towers and looked at the hoisting system with MSI.

November 12, 2013

Weather was fair with temperatures around 39 degrees F all with moderate wind (4 to 10 mph) (wind chill 30 to 38 degrees F) all day and overcast.

The combined inspection team met with Dave Hunz and Gene Lindfors of MSI at about 0800 to get the pre-job safety and operation briefing and visitor passes from MSI. The safety plan was reviewed and the energy source for the ship loader and conveyor motors was locked out and tagged out (LOTO). At the safety meeting it was decided that while Lance Gyldenege was performing his initial inspection of the ship loader with the boom raised and parked, the EAI climbers would drop their climbing ropes down tower corners and the underside of the ship loader boom (bottom facing east) and would inspect the tower structures and boom girders and framing with the boom raised and parked as that would provide the best visibility of the structural members and joint connections in the boom. EAI assignments were Scott Hibbs on the boom, John Gonzales on the South Tower and Peter Fralick on the North Tower. John Magee walked the transfer and reclaim conveyors to perform an overall condition survey of the condition of the conveyors. Gene Lindfors, MSI was safety watch on the dock.

The gangway handling jib boom/hoist attached to the NE leg of the North Tower was found to be failed at the hinged connection bracket and with only one bolt still securing the assembly. MSI was notified and a man lift was moved to the SOT ship loader at the end of the climbing inspection for the day. MSI removed the hoist and jib boom. The mounting bracket assembly remaining on the column was removed by EAI the next day. Inspection of the NE column of the North Tower was not able to be done until this bracket was totally removed as it was not fastened to the column, presenting a hazard to personnel below.

November 13, 2013

Weather was around 32 degrees F all with moderate wind (3 to 5 mph) (wind chill 27 to 28 deg F) in morning and mostly cloudy to overcast, light snow cover from snow in the early morning, water on tower base and structure was frozen.

A safety meeting was held at 0800 in the facility lunch room and the work plan for the day was reviewed with all of the combined team including Dave Hunz. The work plan included the operation of the ship loader hoists and boom luffing system by CRS and the LOTO considerations on energy sources for protection of workers on the ship loader and tower. During the time the ship loader was being operated, EAI personnel would suspend their inspection and be off the ship loader and towers. CRS operating inspection would be done as soon as EAI had cleared any ropes and other climbing safety gear from boom structure in the raised and parked position. After the CRS operating inspection and re-establishment of the LOTO in energy sources, the EAI inspection of the boom and towers could resume with the boom in the lowered position. At the conclusion of the EAI climbing inspection, the ship loader boom would be raised and placed in the parked position.

After the safety meeting, the combined team returned to their inspection of the ship loader. Climber's ropes and gear were cleared from the boom and the LOTO was removed around 0900. The ship loader boom was raised by MSI and CRS commenced the operational inspection/evaluation of the ship loader. No operating (run) test of the ship loader conveyor was done due to possibility of discharging remnant concentrates to Skagway Harbor. Video of the operating ship loading conveyor is to be made by MSI at the next ship load-out and provided to AIDEA and CRS.

At the conclusion of the ship loader operational inspection, the LOTO was re-established and EAI completed their inspection of the ship loader boom structure and the north and south towers.

An exit meeting was held with MSI at the end of the day (around 1630) and the preliminary results of the overall inspection were reviewed with MSI. EAI collected their climbing equipment and the combined team began demobilization, arrangements were made to fly from Skagway to Juneau and onward to team member's respective home bases on Thursday 14 November.

November 14, 2013

Weather deteriorated overnight and by Thursday morning the wind was blowing around 34 mph with gusts to around 50 mph. Temperature was in the 40's and overcast with rain at Skagway. Haines winds were very turbulent. Juneau flights left on time but flights to Anchorage were diverted to Fairbanks for 7.5 hours to wait out freezing fog in Anchorage.

INSPECTION DETAILS AND RESULTS

Data Recording and Photographs

Inspectors recorded and photographed the condition of all elements and connections in the towers and ship loader boom system. Inspection of the mechanical equipment and hoisting system components was not in the R&M scope and is reported on separately by Crane Repair Services. Photographs are sorted by North Tower, South Tower and Ship Loader Boom and are present in tables with transcribed field notes to document the condition of the structural elements and connections. Each tower was inspected by a specific individual and photographs are in sets sorted by individual/date and location. The sets of photographs keyed to inspection notes are included in **Appendices 3, 4 and 5.**

Each photograph is identified by

- Main Component of the Ship Loader,
- Inspector/photographer-date-photo number-facility-main structure
- Location,
- Description - including transcribed notes by inspector relative to the photograph. Condition State, and any specific details noted.

The structure Condition State determinations were guided by the State of Oregon DOT Painted Steel Structures Condition State Descriptions, see **Appendix** 2.

Ship Loader Boom Structure

At welded joints between girders and lateral framing at the bottom plane of the ship loader boom, dirt, flaking paint and rust scale were removed using a glazers knife as a scraper and the condition of the underlying steel was visually evaluated. Each structural joint was assigned a condition state to define the extent of deterioration of the coating and steel elements. See photographs in **Appendix 3** for Boom inspection notes and record photographs.

Example of extreme CS5 deteriorated condition in boom conveyor support framing

It was found that virtually all of the 29 frame joints containing a diagonal frame element are **CS5** and frame joints where members that are in a horizontal position (when the boom is raised and parked)

including framing between the main girders of the boom and between the main girders and I-beam shuttle track/runway were all found to be **CS4/5** to **CS 5** condition in some portion of the element based on material loss in the structural materials. The extensive corrosion encountered could be explained by the boom being luffed up to a vertical position for parking/storage between uses. This position allows water, dirt and residual concentrates to accumulate in the pocket formed by the joint when in a vertical boom position which promoted failure of coatings and corrosion of the steel elements.

In short, the structural framing joints throughout the ship loader boom structural system are CS5 and require extensive remedial repairs for the equipment to operate safely.

Conveyor Shuttle Support Beams

The head chute/drive end of the ship loader conveyor is supported by steel wheels that run on the bottom inside of the I-beam flange. The wheels have a truncated cone shape and this induces a level of lateral thrust to the I-beam runway/track that supports the head chute assembly. The I-beam is laterally supported by the boom girder by way of transverse "blocking" provided by short sections of steel I-beam. Diagonal structural Tee members provide additional lateral support and essentially form a horizontal truss to maintain the left and right runway/track members in relationship one to the other and prevent change in gage that would allow the shuttle to drop through the open area of the spout shuttle slot at the outboard end of the ship loader boom. The right hand (south) shuttle runway track has reduced lateral support due to extreme deterioration and loss of steel section in some of the lateral support blocking and diagonal Tees. This has allowed the gage to increase so the shuttle has less bearing area to support the steel wheels. Also, the left half of the lower flange of the runway/track beam has been bent downward 5/8-inches and the right hand set of wheels on the head chute/drive end of the shuttle has less bearing than the design.

Right hand spout shuttle wheel, runway/track beam and failing lateral support.

The conveyor head chute/drive end shuttle needs urgent remedial repairs to restore the runway/track beams back to correct gage to maintain safe operating condition for the shuttle and head chute.

Ship Loader Guide Towers

The structural joints where the lateral framing members between the load bearing columns of the North and South Guide Towers of the Ship Loader are configured to catch and hold water, dirt and residual concentrate were found to have significant coating loss and steel corrosion in and around the joints; this is primarily framing in the West and East faces of the towers. This is caused by water, dirt and residual concentrates being trapped in pockets formed in the joints by structural member orientation in joints. In some cases joints forming pockets were provided with drain holes which greatly reduced the corrosion problem if the drain holes were large enough and were kept clear of material plugging the hole. ***However, in the two towers of the 44 joints of concern at least 23 are classed as CS4/5 or CS5. Another 28 are classed as CS 3/4 or CS 4.***

Table 1A North Tower – Occurrence of various Condition Status Levels for Tower frame joints
See photographs in Appendix 4.

North tower						
CS2	**CS2/3**	**CS3**	**CS3/4**	**CS4**	**CS4/5**	**CS5**
14	**2**	**10**	**8**	**16**	**7**	**0**

Table 1B South Tower – Occurrence of various Condition Status Levels for Tower frame joints
See photographs in Appendix 5.

South tower						
CS2	**CS2/3**	**CS3**	**CS3/4**	**CS4**	**CS4/5**	**CS5**
4	**1**	**2**	**5**	**6**	**9**	**7**

From the tabulations in Tables 1A and 1B it can be seen that in the lateral load resisting framing of the two guide towers, there are 7 occurrences of CS5, 16 occurrences of CS4/5 and 22 occurrences of CS4. The total number of frame joints requiring urgent remedial repairs is at least 23 (CS5 and CS4/5) and a portion of the CS22 joint conditions also are urgent to repair.

Typical tower frame joint of configuration that pools water; CS5.

Column base plates and bolted splices in the columns and diagonal bracing members need very close examination after removing the rust, coating and any deleterious materials down to bare metal. One concern is that the column-to-base plate welds are still competent based on visual examination. If there is doubt, magnetic particle and dye penetrant methods could be used to determine if there is lack of fusion and/or cracking in the welds. Missing bolts in splices and bolted connections need to be replaced and some existing bolting should be removed and replaced with new bolts.

Guide Tower structural elements urgently need remedial repairs and all joints where water can collect need drain hole of sufficient size to prevent pooling of water.

Guide Tower Base

The base plates of Guide Tower columns and all static and operating elements anchored to the pile cap/base slab need close attention to ensuring grounding strap cables are intact and providing competent ground. In at least one instance the ground cable has broken strands and is in marginal condition at the point it emerges from the base slab.

Example of partially failed ground strap at column base; CS5

Detailed inspection of the Grounding System was not done as part of this inspection, but, incidental observations indicate the system needs attention by qualified person(s).

Findings

Findings of the inspection and evaluation of the ship loader based on the November 11, 2013 through November 13, 2013 inspection are as follows; see Appendix 1-1 for Condition State guidelines and Appendix 1-2 for a view of the East face of the ship loader with boom parked and indication of the locations of urgent repairs for many of the deficiencies:

1. Structural elements and connections within the ship loader boom are in an advanced state of deterioration. Virtually all 29 welded structural connection points between beams and lateral support framing members that are configured to hold water and detritus when the boom is parked are regarded as in Condition State 5 (CS5) and urgently require rehabilitation and/or replacement before the next use of the facility in loading ships.

2. Approximately fifty two percent of welded structural connections between columns and lateral support framing members in the East and West frames of the ship loader towers are deemed as in Condition State 5 (CS5) and urgently require rehabilitation and/or replacement before the next use in loading ships.

3. Safety handrails on the ship loader boom have corroded at the base of posts/balusters and need replacement/rehabilitation to ensure safety of personnel.

4. Wire rope and sheaves need replacement and rehabilitation in accordance with the Crane Repair Services report.

Discussion

The findings of this inspection indicate little attention to structural maintenance has been done since 2007. The ship loader structural systems have deteriorated to the extent that critical connections must be rehabilitated/repaired. If this is done to allow loading ships beginning sometime in February, the critical connections will require attention over the next 45 days or so. To accomplish this, a welding/fabrication contractor would need to be engaged essentially immediately to perform the work needed to the critical connections and elements in the boom needing remediation.

The repair work can be done with the boom down or in the vertical parked position. If in the vertical position, scaffolding would need to be erected on the water side (east side) of the ship loader to allow access to the areas needing rehabilitation. A material hoisting system would need to be established to move structural materials to the point of installation. With the boom up in the parked position marine traffic along the ore dock would be minimally affected.

If done with the boom in the lowered (down) position, access to the work area would be from above and hanging scaffolding would need to be installed. With the boom down, marine traffic along the ore dock would be significantly affected.

Repair/rehabilitation will include removal of defective materials and replacement with new materials cut to fit and welded in place. Patching, flange and web reinforcement including stiffeners and gusset plates to reinforce weakened areas and provide a load path for structural loads will be used to remediate deficient areas. All remedial work will be coated with suitable field applied durable coating material.

To ensure minimal loss of time in effecting repairs, a full time structural engineer/inspector would need to be employed at the job site to be able to assess any problems encountered and establish a repair procedure working with the welding contractor.

Recommendations

Based on the results of this inspection, it is recommended that:

1. The ship loader NOT be operated to load ships until remedial work is done on the structural systems of the ship loader guide towers and the ship loader boom and ship loader conveyor (conveyor #3) shuttle support runway/track system; this includes any remedial work required to the tail roller section of the shuttle as well as the shuttle support beams (these support the carrier rollers for the conveyor shuttle frame) running from the tail end of the conveyor to the head chute.

2. Prepare a rehabilitation action plan that includes continuous inspection of the structural rehabilitation to ensure the remedial structural work is consistent with structural requirements and any hidden conditions can be addressed as they are discovered.

3. The electrical grounding system for the ship loader structure be closely inspected and tested and any broken, damaged or ground straps not in compliance with grounding requirements be replaced.

4. Ship Loader safety features such as hand rails and chains across openings be upgraded including re-securing hand rail posts/balusters to the deck beams of the ship loader.

5. Sand or grit blast the ship loader and boom structures and recoat with a suitable hi-tech coating system.

6. Perform remedial work on the ship loader described in the spout certification inspection report by Crane Repair Services.

7. Re-inspect the ship loader after completion of the work under the certification report and structural rehabilitation/remedial work is completed.

Closure

The results and findings of this inspection indicate the ship loader is in marginal condition at best but, can likely be repaired to provide a safe operating unit for the short term. It is very important to either replace the ship loader with new, modern equipment or perform major repairs and replacement to the present ship loader.

R&M Consultants, Inc. are available at your convenience to review this report and discuss possible means of accomplishing repairs to the facility to allow continuing support of load-out of concentrates.

JG-111213-05 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER BOOM PARKED

DESCRIPTION: SOUTH FACE OF BOOM GIRDER SHOWING SHUTTLE SLOT FOR SPOUT, BOOM INSPECTOR RIGGING UP FOR BOOM INSPECTION

CONDITION STATE CS N/A

JG-111213-01 THRU 04 ARE GENERAL SCENERY PHOTOS, NOT INCLUDED IN CONDITION PHOTOS

JG-111313-19 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP#1

DESCRIPTION: FISH PLATE IN DIAGONAL TO STRENGTHEN WEB (HEAVY SECTION LOSS) DRAIN HOLE IS CLEAR, PAINT CS 4 WITH 1/64-INCH SECTION LOSS TO WEB AND FLANGES.

CONDITION STATE CS4

JG-111313-18 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP#5

DESCRIPTION: VIEW OF UNDERSIDE OF WEB. 6”X3” HOLE.

CONDITION STATE CS5

JG-111313-17 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP# 5

DESCRIPTION: DIAGONALBRACE AT SPLICE 3-INCHES OFF WATER POOLED ON TOP SIDEINBOARD FLANGE HAS HEAVY LAMINAR RUST WITH SECTION LOSS UP TO 1/8-INCH. WEB BETWEEN TOWER AND SPLICE HAS 6”X3” AREA WITH 100% SECTION LOSS.

CONDITION STATE CS5

JG-111313-16 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP# 5

DESCRIPTION: DIAGONALBRACE AT SPLICE 3-INCHES OFF WATER POOLED ON TOP SIDEINBOARD FLANGE HAS HEAVY LAMINAR RUST WITH SECTION LOSS UP TO 1/8-INCH. WEB BETWEEN TOWER AND SPLICE HAS 6”X3” AREA WITH 100% SECTION LOSS.

CONDITION STATE CS5

JG-111313-15 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP# 7

DESCRIPTION: WATER POOLING ON TOP SIDE OF DIAGONAL, HEAVY SECTION LOSS TO FLANGE ON INBOARD UP TO 1/8-INCH (COMMON TO FIND THIS TYPE CORROSION AT THESE LOCATIONS)

CONDITION STATE CS4/5

JG-111313-14 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP# 7

DESCRIPTION: WATER POOLING ON TOP SIDE OF DIAGONAL, HEAVY SECTION LOSS TO FLANGE ON INBOARD UP TO 1/8-INCH (COMMON TO FIND THIS TYPE CORROSION AT THESE LOCATIONS)

CONDITION STATE CS4/5

JG-111313-13 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP#6

DESCRIPTION: PACK RUST FORMING BETWEEN SEAM AT BOLTED CONNECTION. WATER POOLING ABOVE JOINT DUE TO NO DRAIN HOLE. HEAVY SECTION LOSS TO DIAGONAL FLANGES, UP TO 1/8 INCH.

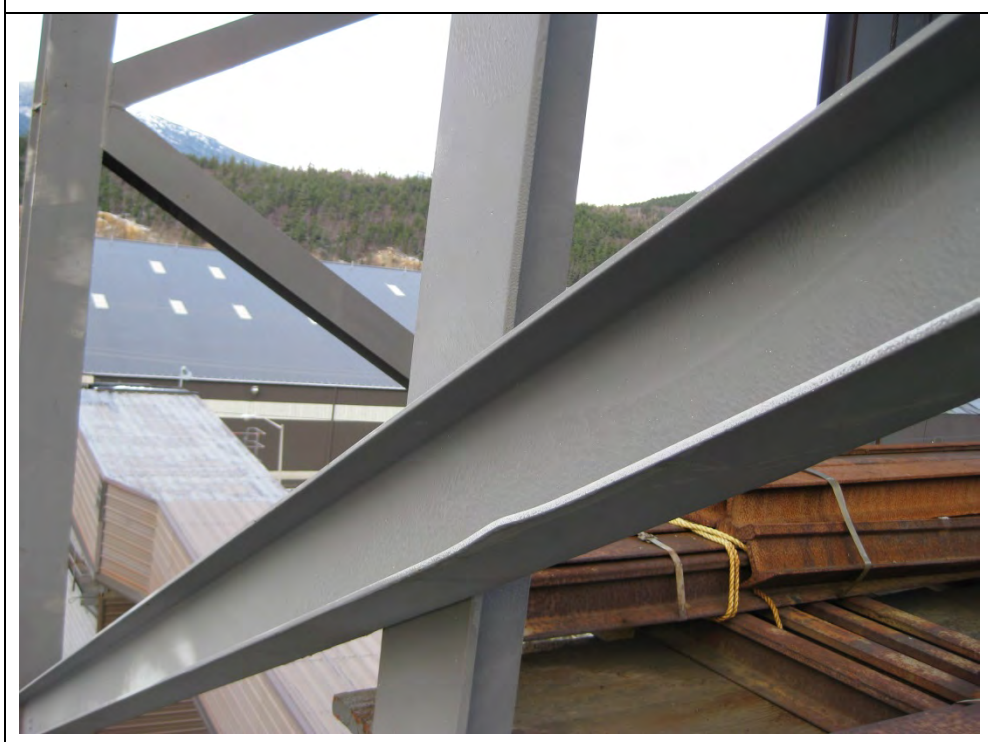
CONDITION STATE CS4/5

JG-111313-12 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER EAST FACE AT PP# 8

DESCRIPTION: OUTBOARD VERTICAL TOWER FLANGE IS BENT OUT OF PLANE UP TO ¼-INCH.

CONDITION STATE CS4



JG-111313-11 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER SOUTH FACE AT SE CORNER PP#9

DESCRIPTION: DIAGONAL BRACE BETWEEN PP#9 AND PP#?

3 FEET FROM PP#9 BOTTOM OUTBOARD FLANGE ISBENT OUT OF PLANE ½-INCH.

CONDITION STATE CS2

JG-111313-10 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWEREAST FACE GIRDER BETWEEN NE AND SE TOWER LEGS

DESCRIPTION: MID SPSN 3'X2' AREA WITH HEAVY LAMINAR RUST FORMING BEHIND FAILED PAINT.

CONDITION STATE CS3

JG-111313-09 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SHIP LOADER BOOM VIEWED FROM ABOVE ON SOUTH TOWER

DESCRIPTION: BOOM STRUCTURE INSPECTION AT SHUTTLE SPOUT SLOT.

CONDITION STATE CS N/A

JG-111313-08 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SHIP LOADER BOOM VIEWED FROM ABOVE ON SOUTH TOWER

DESCRIPTION: BOOM STRUCTURE INSPECTION AT SHUTTLE SPOUT SLOT. NOTE RUSTED FLANGE AND WEB ON LEFT OF OPENING THAT IS CAUSED BY SHUTTLE WHEEL RUBBING.

CONDITION STATE CS N/A

JG-111313-07 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER COUNTER WEIGHT LIFT CABLE CONNECTION TO PULLEY AT TOP PLATFORM

DESCRIPTION: HEAVY CORROSION WITH SECTION LOSS AT THIMBLE.

CONDITION STATE CS5

JG-111313-06 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER COUNTER WEIGHT LIFT CABLE CONNECTION TO PULLEY AT TOP PLATFORM

DESCRIPTION: HEAVY CORROSION WITH SECTION LOSS AT THIMBLE.

CONDITION STATE CS5

JG-111313-05 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER W FACE AT NW CORNER PP#2

DESCRIPTION: HEAVY LAMINAR RUST WITH SECTION LOSS TO INBOARD FLANGE UP TO 1/8-INCH (COMMON TO FIND CORROSION AT THESE LOCATIONS)

CONDITION STATE CS4/5

JG-111313-04 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER W FACE AT NW CORNER AT PP#8

DESCRIPTION: WATER IS POOLING ON TOP[SIDE OF DIAGONAL BRACE. SECTION LOSS TO WEN ON TOWER UP TO 1/16-INCH. 12-INCH OUT FROM TOWER FLANGESS HAVE UP TO ¾-INCH SECTION LOSS. HEAVY CORROSION AT THIS PANEL POINT.

CONDITION STATE CS4/5

JG-111313-03 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER WEST FACE AT NW CORNER

DESCRIPTION: CABLES CONNECTED TO BOOM HOIST PLATFORM HAS HEAVY CORROSION WITH BROKEN STRANDS JUST UNDER THIMBLE SOCKET FITTING.

CONDITION STATE CS5

JG-111313-02 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER W FACE AT NW CORNER LEG PP# 10

DESCRIPTION: HEAVY RUST SCALE/LAMINAR RUST AT WELDS AND BOLTED CONNECTIONS ¼-INCH OF PACK RUST FORMING BETWEEN BOLTED CONNECTIONS.

CONDITION STATE CS4/5

JG-111313-01 SKAGWAY ORE TERMINAL SHIP LOADER

LOCATION: SOUTH SHIP LOADER TOWER W FACE AT NW CORNER LEG

DESCRIPTION: WEB ABOVE NW LEG HAS A 1 FOOT BY 2 FOOT AREA WITH 100% PAINT FAILURE WITH HEAVY LAMINAR RUST FORMING AND SECTION LOSS TO WEB.

CONDITION STATE CS4/5

SCALE: 1/4" = 1'-0"

NOTES

1. BATTER NORTH–SOUTH PILING 3V:1H, AND EAST–WEST PILING 4V:1H.
2. BULL RAIL ON NEW CAPS NOT SHOWN.
3. LOADER TOWER AND OTHER FEATURES ON EXIST. PLATFORM NOT SHOWN.
4. TEMPORARY PILING:
   - TEMPORARY PILING ARE TO BE INSTALLED ONLY IF IT IS NECESSARY TO REMOVE EXISTING PILING IN ORDER TO CONSTRUCT NEW BEAMS UNDER THE SHIPLOADER PLATFORM.
   - FOR EACH PILE REMOVED PROVIDE ONE 18" DIAMETER X 0.375" WALL TEMPORARY PILE.
   - DRIVE TEMPORARY PILES TO A 30 TON WORKING CAPACITY, BUT NO LESS THAN 50 FT. PENETRATION.
   - CUT OFF TEMPORARY PILING AT AN ELEVATION SUFFICIENT TO ALLOW INSTALLATION OF 30 TON JACKS.
   - BRACE THE TOP OF TEMPORARY PILING AGAINST ADJACENT PILING OR THE UNDERSIDE OF THE LOADER PLATFORM WITH A MINIMUM OF TWO BRACES POSITIONED AT APPROXIMATELY 90° TO ONE ANOTHER. THE CONTRACTOR SHALL BE RESPONSIBLE FOR DESIGNING THE BRACES AND PROVIDING AN INSTALLATION PLAN TO THE ENGINEER.
   - WELD A MINIMUM 1" THICK PLATE TO THE TOP OF THE TEMPORARY PILING AND PLACE A BEARING PLATE BETWEEN THE 30 TON JACKS AND THE LOADER PLATFORM. THE BEARING PLATE SHALL BE 1" THICK AND HAVE A BEARING AREA OF NOT LESS THAN 1" SQUARE FOOT.
   - LOAD AND MAINTAIN EACH OF THE JACKS AT 20 TONS. LOAD THE JACKS SEQUENCIALLY IN 4 TON INCREMENTS.
   - THE CONTRACTOR MAY INSTALL ADDITIONAL TEMPORARY PILING.
   - REMOVE TEMPORARY PILING AND BRACING FOLLOWING POST–TENSIONING OF BEAMS NOL. 1 AND NO. 2.
   - TEMPORARY PILING NEED NOT BE GALVANIZED.
5. DO NOT REMOVE FORMS OR SHORING FOR BEAMS NO. 1 AND NO. 2 UNTIL CONCRETE REACHES SUFFICIENT STRENGTH TO TRANSFER WEIGHT OF BEAMS TO #7 DOWELS IN VENT HOLES.

AS-BUILT SHIP LOADER, DOCK ACCESS, PEDESTRIAN BRIDGE

Scale 1" = 10'

NOTES:

1. The pump pad at the intermediate tower is to be relocated to the approximate location shown on Plan Sheet A-1. The contractor will coordinate with the owner the exact location of the relocated pump pad. The relocation includes moving the pump and pump support and constructing a new concrete sump attached to the intermediate tower. The relocation includes moving the necessary electrical service and relocating the 4" poly pip connection to the 4" poly pipe attached to the access dock. All electrical work shall conform to the 1990 NEC. The work also includes modifying the existing tower enclosure as necessary so that the sludge can be drained to the sump pump.

2. All poly pipe seams to be butt welded. Solvent seams are not acceptable. Mechanical joints are permissible only at the sump pump connections. Ninety degree bends on the poly pipe attached to the access dock are not to be used. Bends on this part of the poly pipe systems should not exceed 30 degrees at a time.

3. Existing electrical conduit and services on the existing wooden dock are to be maintained in service during construction and rerouted as necessary to accommodate the new work. All work shall conform to the 1990 NEC.

4. All existing service panels located on the dock are to remain and if necessary to be relocated to accommodate the new work. The owner shall approve any relocation of existing panels. All work shall conform to the 1990 NEC.

5. Existing lights on the dock are to remain in place. If necessary the owner shall approve any relocation.

6. Existing timber and chicken wire railing on the access dock shown on Drawing A-1 is to be replaced. Railing to be constructed of pressure treated lumber not less than 2x4 in dimension. All fasteners to be galvanized. All wire to be galvanized. Railing to be the same height as the existing railing. Railing to be replaced on both sides of the approach dock. On the southerly side of the dock the railing is to be replaced in its total length. On the northerly side of the approach dock the railing is to be replaced from the beginning at the shore to the location of the 3" galvanized hose bid. If the contractor dumages the rail in any other area it shall be repaired as directed by the engineer.

7. The existing approach dock planking is 11 1/2"x4" finished.
Existing bents are 12"x12" creosote timbers.
Outside stringers are 10"x13" creosote timbers.
Interior stringers are 6"x13 1/12" creosote timbers.
Railing on both sides consists of 2.4 framing with chicken wire, railing 30" high with posts at 4'-6" c-c.

BORING NOTES

1. BORING LOGS ARE TAKEN FROM SOILS REPORT ENTITLED "SOIL INVESTIGATION, PROPOSED ORE TERMINAL, WHITE PASS AND YUKON ROUTE, SKAGWAY, ALASKA," BY GOLDER, BRAWNER AND ASSOCIATES, LTD., VANCOUVER, B.C., DATED MAY 1967.
2. THE SUBSURFACE INFORMATION AND DATA HEREIN ARE NOT INTENDED AS REPRESENTATIONS OR WARRANTIES, BUT ARE FURNISHED FOR INFORMATION ONLY. IT IS EXPRESSLY UNDERSTOOD THAT THE OWNER AND ENGINEER, OR EITHER, WILL NOT BE RESPONSIBLE FOR THE ACCURACY THEREOF OR FOR ANY DEDUCTION, INTERPRETATION, OR CONCLUSION DRAWN THEREFROM BY THE CONTRACTOR. THE INFORMATION IS MADE AVAILABLE IN ORDER THAT THE CONTRACTOR MAY HAVE READY ACCESS TO THE SAME INFORMATION AVAILABLE TO THE OWNER AND ENGINEER, OR EITHER, AND IS NOT A PART OF THIS CONTRACT. (SEE SPECIAL PROVISIONS.)
3. ALL ELEVATIONS REFER TO THE PLANE OF MEAN LOWER LOW WATER (M.L.L.W. = 0.00 FEET).
4. SEE GENERAL PLAN, DRAWING NUMBER 2555-GE-3, FOR BORING LOCATIONS.
5. LEGEND:

   Ph: SAMPLER ADVANCED BY HYDRAULIC PRESSURE
   > : GREATER THAN
6. "GROUND SURFACE" SHOWN ON THESE BORINGS REFER TO ORIGINAL GROUND ELEVATIONS ON DATE WHEN BORINGS WERE TAKEN, PRIOR TO DREDGING AND HYDRAULIC FILL OPERATION CONDUCTED UNDER PHASE I PROJECT. "LIMIT OF EXCAVATION - PHASE I" AND "LIMIT OF FILL - PHASE I" INDICATED ON THESE BORING LOGS. DOES NOT PURPORT TO BE "AS-BUILT" CONSTRUCTION COMPLETED UNDER PHASE I AT THE TIME OF AWARD OF THIS CONTRACT.
